

Applications of Circle Theorems with Marine Navigation

CONCLUSION

In this project, we learned a lot about the applications of mathematics in real life. First of all, we were already challenged with coming up with a topic on our own. This was a completely new thing for us, and I'm glad that the teacher had us do this method. We believe it encourages creativity and improves the learner's thinking process.

We decided that we will go with a model and a website. However, we subsequently found out that the cost of buying a finished model of a ship is quite out of our budget. It was our fault that we didn't research the logistics of submitting a model of a ship before sending in the project proposal form, however the teacher agreed for us to just create a poster. The website still stands, and it is probably where you downloaded this file from.

After tens of hours of work, we think that our poster is one of the best ones we have ever done. With advice from other teachers, we had a clearer understanding of the subject. We encountered some problems along the way, however we were able to get past them and continue on with the project.

This project wouldn't have happened without the teacher of the course, who also gave us invaluable advice and taught us to be able to learn by ourselves. We hope that this project meets your expectations. We apologize if it is lacking in some way, or if something that we said or did in this course had upset you in any way.

Thank you!
